# Chapter 3 Dynamics 

Newton's Laws

## Newton's 1st Law

- Objects with mass have Inertia: the tendency to stay at rest (or moving!)
- The more mass an object has, the more difficult it is to accelerate

- Waiter trick
- AKA paper and funnel trick
- Penny and cardboard

## Gaijin Yokozuna!?

## Newton's $2^{\text {nd }}$

- The force necessary to m objects depends on:
- mass
- acceleration

## F

- Ex 1: how much force is necessary to accelerate a 80 kg student at $10 \mathrm{~m} / \mathrm{s}^{2}$ ?

$$
F_{n e t}=m a=80 \mathrm{~kg} \cdot 10 \mathrm{~m} / \mathrm{s}^{2}=800 \mathrm{~N}
$$

## What do we mean "net" force?

- Net force is zero if there are no unbalanced forces
- We usually do not notice forces until they become unbalanced
- Ex. What are the forces acting on these suction cups?

## Free Body Diagrams

- The point of a FBD is to simplify the dynamics involved
- We only point out the forces acting on the body in question
- To get to the point, we draw the body as a... point!

$$
\mathrm{F}_{3}
$$

- The forces are drawn pointing away from the body

## Any questions

 ?Kid who's had their hand up for so long that they had to take it down because they literally couldn't hold it up for any longer

## Kid who's stretching

## What if there is more than one

## force?

- Ex 2: Jordan applies a 50 N force to a 2.5 kg book to slide it across the table. Find the acceleration if there is a 45 N friction force resisting this motion
- This is a vector equation, so we have to consider these opposing vector forces as having opposite signs

net
$=m a$

$$
a=\frac{F_{n e t}}{m}=\frac{F_{a}+F_{f}}{m}
$$

$$
a=\frac{50 N+(-45 N)}{2.5 k g}
$$

$$
\frac{5.0 \mathrm{~N}}{2.5 \mathrm{~kg}}=2.0 \mathrm{~m} / \mathrm{s}^{2}
$$

## Solve for coefficient of friction

- If Dawn pulls Bradey (579N) across the floor with a 90 N force at $40^{\circ}$ above the horizontal, find $\mu$

$$
\begin{array}{c|c}
F_{M x}=90 \cos 40=68.9 \mathrm{~N} & F_{M y}=90 \sin 40=57.9 \mathrm{~N} \\
F_{f}=-F_{M x}=68.9 \mathrm{~N} & R=-F_{g}-F_{M y} \\
\mu=\frac{F_{f}}{R}=\frac{68.9}{521}=0.13 & =-(-579)-57.9 \\
=521 \mathrm{~N}
\end{array}
$$

## Exercises

- Start p. 66-7 \#4,6
- \#4 F=ma
- $\mathrm{F}_{\mathrm{g}}+\mathrm{F}_{\mathrm{T}}=\mathrm{ma}$
- $m g+(-65 g)=m a$
- $\mathrm{a}=(75(-9.8)+(-65)(-9.8)) / 75$

## Double Body Diagrams

1.A diagram that has two (or more) masses in it [often involving inclined plane and/or pulley]
2.Consider what external forces are affecting the system as a whole. *What about tension!?*
3.Decide what is negative ( - ) and what is positive (+) from the diagram, NOT from numbers!

## 

5 kg

## Considering the system

- We only have two external forces

$$
\begin{array}{ll}
\mathrm{F}_{\mathrm{g} 2} \longleftarrow \circ \longrightarrow \mathrm{~F}_{\mathrm{g} 3} \\
F_{g 2}=m g & F_{g 3}=m g \\
=2.0 \mathrm{~kg} \times(-9.8 \mathrm{~N} / \mathrm{kg}) & =3.0 \mathrm{~kg} \times(-9.8 \mathrm{~N} / \mathrm{kg}) \\
=19.6 \mathrm{~N} & =29.4 \mathrm{~N}
\end{array}
$$

## Now use $2^{\text {nd }}$ Law

$$
F_{n e t}=m a
$$

## Evaluation

- Compare your experimental results with the theoretical prediction

$$
\% \text { diff }=\frac{\operatorname{experimental}-\text { theoretical }}{\text { theoretical }} \times 100 \%
$$

$$
\% \text { diff }=\frac{2.2-2.0}{2.0} \times 100 \%=10 \%
$$

- Finish with an analysis of sources of error and possible improvements

## Now find tension

- Apply Newton's $2^{\text {nd }}$ law to just one mass:

$$
\mathrm{F}_{\mathrm{T}}
$$

$$
\begin{gathered}
F_{T}+F_{g 2}=m a \quad F_{T}=m a-F_{g 2} \\
=2(1.96)-(-19.6 \mathrm{~N})=24 \mathrm{~N}
\end{gathered}
$$

$$
\text { Try \#3 p. } 67
$$

## Inclined plane?

We can tilt our axes so $x$ is parallel, $y$ is perpendicular to the surface

## Tsompple 2\% Inclivoed 2 body

## Considering the 12 kg mass

- We only have unbalanced forces in the x-direction

## Considering the 10 kg mass

- We only have forces in the $y$ direction

$$
\begin{gathered}
F_{g}=m g=10.0 \mathrm{~kg} \times(-9.8 \mathrm{~N} / \mathrm{kg}) \\
=98 \mathrm{~N}
\end{gathered}
$$

## Considering The System

- Manually apply the correct polarity depending on which forces are opposing

$$
F_{n e t}=m a \quad F_{g x}+F_{g 10}=m a
$$

$$
a=\frac{102 N+(-98) N}{22 k g} \quad a=0.17 \mathrm{~m} / \mathrm{s}^{2}
$$

## Tsompple 3o lmclivoed 2 body

## Considering the 3 kg mass

- We only have forces in the $y$ direction

$$
\begin{gathered}
\left\{\begin{array}{c}
\mathrm{F}_{\mathrm{g}} \\
F_{g}=m g \\
=3.0 \mathrm{~kg} \times(-9.8 \mathrm{~N} / \mathrm{kg}) \\
\\
=29.4 \mathrm{~N}
\end{array}\right. \\
\mathrm{F}_{\mathrm{T}} \\
\mathrm{~F}^{2}
\end{gathered}
$$

## Considering Mass 1

- We only have unbalanced forces in the x-direction

$$
\begin{array}{l|l}
x & y
\end{array}
$$

## Considering The System

- Manually apply the correct polarity depending on which forces are opposing

$$
\begin{aligned}
F_{n e t} & =m a \quad F_{g x}+F_{g 3}=m a \\
a & =\frac{-9.8 N+29.4 N}{5 k g} \quad a=3.9 \mathrm{~m} / \mathrm{s}^{2}
\end{aligned}
$$

## 

## Considering mass 1

- We only have unbalanced forces in the x-direction

## Considering mass 2

- We only have forces in the $y$ direction

$$
F_{g}=m g=8.0 \mathrm{~N}
$$

## Finding acceleration

Use data from vidanalysis or stopwatch (take several trials) 1.21 .82 .43 .02 .6
Ex: $s=u t+1 / 2 a^{2}$
$a=2 \mathrm{~s} / \mathrm{t}^{2}$
$a=2(0.5) / 2.0^{2}$
$\mathrm{a}=0.25 \mathrm{~m} / \mathrm{s}^{2}$

## Finding friction

$F_{n e t}=m a$

$$
\begin{aligned}
& F_{g \times 1}+F_{g 2}+F_{f}=m a \\
& F_{f}=m a-F_{g \times 1}-F_{g 2} \\
& F_{f}=(0.82+0.42) 0.16-(-1.0)-8.0 \\
& F_{f}=1.24(0.16)-7.0 \mathrm{~N} \\
& F_{f}=-6.8 \mathrm{~N}
\end{aligned}
$$

## Theoretical acceleration

$$
F_{n e t}=m a
$$

$$
\begin{aligned}
& \mathrm{F}_{\mathrm{gx} 1}+\mathrm{F}_{\mathrm{g} 2}=\mathrm{ma} \\
& \mathrm{a}=\left(\mathrm{F}_{\mathrm{gx} 1}+\mathrm{F}_{\mathrm{g} 2}\right) / \mathrm{m} \\
& \mathrm{a}=(-1 \mathrm{~N}+8 \mathrm{~N}) /(0.82+0.42) \\
& \mathrm{a}=5.6 \mathrm{~m} / \mathrm{s}^{2}
\end{aligned}
$$

- Finish
$-3 \mathrm{~b}) \mathrm{U}$
$\mathrm{F}_{\mathrm{T}}+\mathrm{F}_{\mathrm{g}}=\mathrm{r}$

Can we use an inclined plane to find the friction coefficient for a book on your table?

## Newton's 3 ${ }^{\text {rd }}$ Law

- For every action there is an equal and opposite reaction
- When you hit something, it hits back!

You exert as much gravitational force on the Earth as it exerts on you
nal (Reaction)Foı

- When an object is in contact with a supporting surface, it pushes down on that surface
- Newton's 3rd Law states the surface pushes back with an equal and opposite force
- This is often (but not always!) equal to the object's weight, hence "apparent weight"

## Simple case: object at rest

- Ex 3: What is the normal force acting on the 2.5 kg book resting on your desk?
- What forces act on the book?
-Free body diagram

$$
F_{n e t}=m a
$$

an

$$
F_{g}+F_{N}=0
$$

$$
F_{N}=-m g=24.5 N
$$

## Extended object at rest

- Ex 4: what is the normal force acting on your book as you lean on it with a 35 N force?
- What forces act on the book?
- Gravity and Normal force, applied force
- Free body diagram
- Apply 2nd law

$$
F_{N}=-F_{g}-F_{a}=-(-24.5 N)-(-35 N)
$$

## Accelerating object

- Ex 5: find the normal force acting on a 50 kg student accelerating upwards at 3.4 $\mathrm{m} / \mathrm{s}^{2}$
- What forces act on the student?
- Gravity and Normal force
- Free body diagram
- Apply 2nd law

$$
F_{N}=-(-490 \mathrm{~N})+\left(50 \mathrm{~kg} \cdot 3.4 \mathrm{~m} / \mathrm{s}^{2}\right) \quad F_{N}=660 \mathrm{~N}
$$

1)a)Find the vector sum

Ex 1) Given diagram a)find $F_{N}$ b)find a

$c^{2}=a^{2}+b^{2}-2 a b \cos C \quad c=164 N$
$\frac{\sin 135}{164}=\frac{\sin \theta}{50} \quad \theta=\sin ^{-1}\left(\frac{50 \sin 135}{164}\right)=12^{\circ}$

## 1)b)draw the resultant

## $164 N$

18 응

## Ty̧akice <br> (O)wisu

2)a)Find the vector sum

Ex 1) Given diagram a)find $F_{N}$ b)find a

$c^{2}=a^{2}+b^{2}-2 a b \cos C \quad c=164 N$
$\frac{\sin 135}{164}=\frac{\sin \theta}{50} \quad \theta=\sin ^{-1}\left(\frac{50 \sin 135}{164}\right)=12^{\circ}$

## Ex 2) a) FBD

## Ex 2) b) Find the "Kaz" Force

$$
\begin{array}{c|c}
x & y \\
\hline F_{n e t}=m a & F_{n e t}=m a \\
F_{a}+F_{f}=m a & R=-F_{g}=440(9.8) \\
F_{a}=440(1.5)-0.15(-4312) & R=4312 \mathrm{~N} \\
F_{a}=1.3 \mathrm{kN} &
\end{array}
$$

$$
\begin{gathered}
F_{n} \\
R=-F_{g}-F_{a y}=-m g-65 N \sin \left(-25^{\circ}\right) \\
F_{N}=76.5 \mathrm{~N}
\end{gathered}
$$

$$
\begin{gathered}
F_{f}=\mu R \\
F_{f}=0.25 \times 76.5 N \\
\ldots \\
F_{f}=-19.1 N ?
\end{gathered}
$$

$$
\begin{gathered}
\overbrace{\mathrm{F}_{\mathrm{g}}}^{\mathrm{F}_{\mathrm{a}}} \begin{array}{c}
\mathcal{X} \\
F_{n e t}=m a \\
a=-\frac{F_{a x}+F_{f}=m a}{m}=\frac{-19.1 \mathrm{~N}+65 \mathrm{~N} \cos \left(-25^{\circ}\right)}{5 \mathrm{~kg}} \\
\\
=7.96 \mathrm{~m} / \mathrm{s}^{2}
\end{array}
\end{gathered}
$$

## Friction

- Friction is a force between two objects sliding (or trying to slide) past each other
- Friction force increases when you have more:
- force between the objects
- roughness of the surfaces

## Friction

- We find friction force is proportional to the Normal force and a "stickiness factor" $\mu$ (called the coefficient of friction)

$$
F_{f}=\mu R
$$

- Ex 1: find the friction force acting on your 2.5 kg textbook as it slides across the table if $\mu=0.55$

## Ex 1: m=2.5 kg, $\mu=0.55$

$$
\begin{gathered}
\mathcal{Y} \\
R+F_{g}=0 \\
R=-F_{g}=-m g \\
\left|F_{f}\right|=\mu R=\mu m g \\
\left|F_{f}\right|=0.55(2.5) 9.8 \\
\left|F_{f}\right|=13.5 \mathrm{~N}
\end{gathered}
$$

## Object on an incline

We can redefine $x$ and $y$ as parallel and perpendicular to the surface
This means $F_{g}$ must be resolved into components $F_{g x}$ and $\mathrm{F}_{\mathrm{gy}}$
$F_{g x}=F_{g} \cos \theta$
$F_{g y}=F_{g} \sin \theta$

The

## catch!!!

- When we look at $\theta$, we see it is usually NOT the angle given
- $\theta=90^{\circ}-40^{\circ}=50^{\circ}$
- Since there is no y acceleration:

| $x$ | $y$ |
| :---: | :---: |
| $F_{n e t}=m a$ | $F_{n e t}=m a$ |
| $F_{g x}=m a_{x}$ | $R+F_{g y}=0$ |

## Find a , neglecting friction

- With no friction, the y direction takes care of itself
- In the x-direction:

$$
\begin{aligned}
& F_{g x}=m a_{x} \\
& F_{g x}=m a_{x}
\end{aligned}
$$

$$
\begin{aligned}
& F_{n e t}=m a \\
& \quad R+F_{g y}=0
\end{aligned}
$$

## Ex: find a , neglecting friction

- The only acceleration will be in the $x$-direction
- The only $x$ force is $F_{g x}$

$$
F_{g x}=F_{g} \cos \theta=m g \cos \theta
$$

$$
F_{n e t}=m g \cos \theta=m a_{x} \quad a_{x}=\frac{m g \cos \theta}{m}=g \cos \theta
$$

## Ex 1: find a, with $\mu=0.25, \mathrm{~m}=2.1 \mathrm{~kg}$

$y$

$$
R+F_{g y}=m a_{y}=0
$$

$$
R=-F_{g y}=-m g \sin \theta
$$

$$
\left|F_{f}\right|=\mu R=\mu m g \sin \theta
$$

$$
\begin{gathered}
\mathcal{X} \\
F_{n e t}=F_{g x}+F_{f}=m a_{x} \\
a_{x}=\frac{m g \cos \theta-\mu m g \sin \theta}{m}
\end{gathered}
$$

- We now have $F_{g x}$ and $F_{f}$ in the $x$-direction
- In order to find $F_{f}$ we also need to look at the y-direction

## Ex 1: find a, with $\mu=0.25, m=2.1 \mathrm{~kg}$

$$
\begin{aligned}
& F_{n e t}=F_{g x}+F_{f}=m a_{x} \\
& a_{x}=\frac{F_{g x}+F_{f}}{m}=\frac{13.2 \mathrm{~N}+(-3.94 \mathrm{~N})}{2.1 \mathrm{~kg}}
\end{aligned}
$$

$$
=4.4 \mathrm{~m} / \mathrm{s}^{2}
$$

## Ex \#5 p. 67: find a, with $\mu=0.12$, $\mathrm{m}=72 \mathrm{~kg}, 35$ degree slope

 $x$
$F_{n e t}=F_{g x}+F_{f}=m a_{x}$
$\left|F_{f}\right|=\mu R=\mu m g \sin \theta$
$R=-F_{g y}=-m g \sin \theta$ $a_{x}=\frac{m g \cos \theta-\mu m g \sin \theta}{m}$

$$
R+F_{g y}=0
$$

$$
R=-F_{g y}=-m g \sin \theta
$$

$a_{x}=g(\cos \theta-\mu \sin \theta)=9.8(\cos 55-0.12 \sin 55)=4.66 \frac{\mathrm{~m}}{s^{2}}$

## Questions

- Finish p. 67 \#1-6
- Start Chapter Review p. 95 \#1-2, 23-25

## Ex 2: How steep?

- If you have enough power, the only limiting factor is $\mu$
- For the critical case, friction force is at a maximum
- To barely make it up the hill, balance $x$ forces

## Ex 2: How steep for $\mu=1$ ?

$y$

$$
R+F_{g y}=m a_{y}=0
$$

$$
R=-F_{g y}=-m g \sin \theta
$$

$$
x
$$

$$
F_{f}=\mu R=\mu m g \sin \theta
$$

$$
F_{n e t}=F_{f}+F_{g x}=0
$$

$$
m g \cos \theta=\mu m g \sin \theta
$$

- We have $F_{g x}=-F_{f}$ in the $x$-direction
- In order to find $F_{f}$ we also need to look at the $y$-direction

$$
\begin{aligned}
& \tan \theta=\frac{1}{\mu} \\
& \theta=\tan ^{-1}\left(\frac{1}{\mu}\right)
\end{aligned}
$$

## How steep is a ?

## Ex 2: How steep?

- How steep if $\mu=0.9$ ?

$$
\theta=\tan ^{-1}\left(\frac{1}{\mu}\right) \quad \theta=\tan ^{-1} \frac{1}{0.9}=48^{\circ}
$$

- How steep if $\mu=0.1$ ?

$$
\begin{gathered}
\theta=\tan ^{-1} \frac{1}{0.1}=84^{\circ} \\
\phi=6^{\circ}
\end{gathered}
$$

## Ex 3: Find $\mu$

- Dayton tilts the table until the object starts sliding.
- What is $\mu$ ?

## Ex 3: Find $\mu$

- Use the y direction to find the normal force
- $F_{g x}=-F_{f}$ in the $x-$

$$
F_{N}+F_{g y}=m a_{y}=0
$$

$$
F_{N}=-F_{g y}=-m g \sin \theta
$$ direction at the point it

$$
x
$$ just starts sliding

$$
F_{f}=\mu F_{N}=\mu m g \sin \theta
$$

$$
\tan \theta=\frac{1}{\mu}
$$

$$
F_{n e t}=F_{f}+F_{g x}=0
$$

$$
m g \cos \theta=\mu m g \sin \theta
$$

## Double Body Diagrams

1.A diagram that has two (or more) masses in it [usually involving inclined plane and/or pulley]
2.Consider what external forces are affecting the system as a whole. Don't worry about tension!
3.Decide what is negative ( - ) and what is positive (+) from the diagram, NOT from numbers!

# [zample 1: Simple 2 body 

Pulley Situation
Ex 1) Given diagram, what is acceleration of 3kg mass?

2kg

## Considering the system

- We only have two external forces

$$
\begin{array}{ll}
\mathrm{F}_{\mathrm{g} 2} \longleftarrow \circ \longrightarrow \mathrm{~F}_{\mathrm{g} 3} \\
F_{g 2}=m g & F_{g 3}=m g \\
=2.0 \mathrm{~kg} \times(-9.8 \mathrm{~N} / \mathrm{kg}) & =3.0 \mathrm{~kg} \times(-9.8 \mathrm{~N} / \mathrm{kg}) \\
=19.6 \mathrm{~N} & =29.4 \mathrm{~N}
\end{array}
$$

## Considering the system

- Applying Newton's $2^{\text {nd }}$ law:

$$
\mathrm{F}_{\mathrm{g} 2} \longleftarrow \circ \longrightarrow \mathrm{~F}_{\mathrm{g} 3}
$$

$F_{n e t}=m a$

$$
\begin{aligned}
a= & \frac{F_{n e t}}{m}=\frac{F_{g 2}+F_{g 3}}{m}=\frac{-19.6 \mathrm{~N}+29.4 \mathrm{~N}}{5 \mathrm{~kg}} \\
& =1.96 \mathrm{~m} / \mathrm{s}^{2}
\end{aligned}
$$

## Considering the system

- Applying Newton's $2^{\text {nd }}$ law:

$$
\mathrm{F}_{\mathrm{g} 2} \longleftarrow \circ \longrightarrow \mathrm{~F}_{\mathrm{g} 3}
$$

$F_{n e t}=m a$

$$
\begin{aligned}
a= & \frac{F_{n e t}}{m}=\frac{F_{g 2}+F_{g 3}}{m}=\frac{-19.6 \mathrm{~N}+29.4 \mathrm{~N}}{5 \mathrm{~kg}} \\
& =1.96 \mathrm{~m} / \mathrm{s}^{2}
\end{aligned}
$$

## esample 2: Inclined 2 body

Double Body Diagram: neglect friction for now Ex 1) Given diagram, what is acceleration of $\mathrm{m}_{1}$ ?

## Considering Mass 2

- We only have forces in the $y$ direction

$$
\begin{gathered}
\left\{\begin{array}{c}
\mathrm{F}_{\mathrm{g}} \\
F_{g}=m g \\
=3.0 \mathrm{~kg} \times(-9.8 \mathrm{~N} / \mathrm{kg}) \\
\\
=29.4 \mathrm{~N}
\end{array}\right. \\
\left.\mathrm{F}_{\mathrm{T}}\right) \\
\mathrm{F}^{2}
\end{gathered}
$$

## Considering Mass 1

- We only have acceleration in the xdirection

$$
\begin{array}{c|c}
x & y \\
F_{g x}=m g \cos \theta & F_{n e t}=m a \\
F_{g x}=-9.8 N & F_{N}+F_{g y}=0 \\
F_{N}=-m g \sin \theta
\end{array}
$$

## Considering The System

- We have to look at unbalanced forces and which ones are opposing to manually apply the correct polarity

$$
\begin{array}{r}
F_{n e t}=m a \quad F_{g x}+F_{g 3}=m a \\
a=\frac{-9.8 N+29.4 N}{5 \mathrm{~kg}} \quad a=3.9 \mathrm{~m} / \mathrm{s}^{2}
\end{array}
$$

## Now including friction:

Ex 1) Given $\mu=0.23$, what is the acceleration of $\mathbf{m}_{1}$ ?

$a=? \mathbf{m} / \mathbf{s}^{2}$

## Considering Mass 2

- We only have forces in the $y$ direction

$$
\begin{gathered}
\left\{\begin{array}{c}
\mathrm{F}_{\mathrm{g}} \\
F_{g}=m g \\
=3.0 \mathrm{~kg} \times(-9.8 \mathrm{~N} / \mathrm{kg}) \\
\\
=29.4 \mathrm{~N}
\end{array}\right. \\
\left.\mathrm{F}_{\mathrm{T}}\right) \\
\mathrm{F}^{2}
\end{gathered}
$$

## Considering Mass 1

- We only have acceleration in the xdirection, but we have to balance $y$ forces to solve for friction

$$
\begin{array}{c|c}
x & y \\
F_{f}=-\mu m g \sin \theta & F_{n e t}=m a \\
F_{f}=3.904 N & F_{N}+F_{g y}=0 \\
F_{g x}=m g \cos \theta & F_{N}=-m g \sin \theta \\
F_{g x}=-9.8 N &
\end{array}
$$

## Considering The System

- We have to look at unbalanced forces and which ones are opposing to manually apply the correct polarity

$$
\begin{gathered}
F_{n e t}=m a \quad F_{f}+F_{g x}+F_{g 2}=m a \\
a=\frac{-3.904 N-9.8 N+29.4 N}{5 k g} \quad a=3.1 \mathrm{~m} / \mathrm{s}^{2}
\end{gathered}
$$

## Exercises
